

## We went through everything you sent — here's where each item stands

Thank you for the detailed feedback and screenshots. Nothing got lost.

### DONE & LIVE NOW — EVERY ITEM YOU SENT

|        |                                                                                                                                                                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ✓ Done | <b>Clone count fixed.</b> Deleting a tray to redo it now subtracts those clones from the mother — no more 237-instead-of-119.                                                                                                                                                                                       |
| ✓ Done | <b>Quieter board.</b> A new tray no longer drops a task for <i>every</i> rooting day — one clone-room temp/humidity task per tray. Duplicate "build grow calendar" reminders cleared.                                                                                                                               |
| ✓ Done | <b>Everything in order.</b> Clone trays now run <b>T1</b> → <b>T49</b> and mothers <b>M1</b> → <b>M29</b> in proper order — no more 2, 15, 25; no hunting for missed trays.                                                                                                                                         |
| ✓ Done | <b>Record Harvest.</b> A "Record harvest" button captures the actual <b>wet weight (kg)</b> per harvest (e.g. Elvis, SI) with the date — variance vs the estimate is worked out for you.                                                                                                                            |
| ✓ Done | <b>Edit the Environmental &amp; Activity logs.</b> You can now correct any entry — and <b>every edit asks for a reason and is logged</b> (date, time, who, before & after), so the record stays audit-clean for GMP. Nothing is changed silently.                                                                   |
| ✓ Done | <b>Chemical &amp; Foliar — free entry.</b> On the activity log you can now set your <b>own time</b> , the <b>equipment #</b> and the <b>dose / rate</b> (e.g. 5 ml/L) for sprays — no fixed slots.                                                                                                                  |
| ✓ Done | <b>More cleaning schedules.</b> Added: <b>PPE (mother &amp; GH)</b> , <b>cultivation area</b> , <b>general area</b> and <b>irrigation</b> — alongside greenhouse, mother bay and clone room.                                                                                                                        |
| ✓ Done | <b>Cleaning frequencies are tickable.</b> Weekly / monthly / before- & after-batch rows now take your initials too — not just the daily tasks.                                                                                                                                                                      |
| ✓ Done | <b>Harvested pots now show.</b> On BayGrid a pot can be marked <b>Harvested</b> — single pot or many at once — and it turns <b>blue</b> so you can see at a glance what's been pulled. The pot detail shows the status & harvest date. It stays blue until you <b>Clear</b> it to free the slot for the next plant. |
| ✓ Done | <b>Checklists run Mon–Fri.</b> Daily checklists no longer generate on Saturday & Sunday — ILCO is closed over weekends, so no more weekend tasks piling up as "overdue".                                                                                                                                            |
| ✓ Done | <b>Clearing a pot now really empties it.</b> Fixed: on BayGrid (e.g. GH2 Bay 5 Row 3 & 4) clearing a pot now <b>removes the strain too</b> , so it shows as empty (grey) instead of keeping its old colour. No more "delete till you're blue and it won't go". Blue = harvested stays until you Clear.              |
| ✓ Done | <b>Cleaning lists corrected.</b> Greenhouse weekly items moved to <b>after-batch</b> (done in the deep clean); PPE "launder reusable gowns" moved to <b>daily</b> (it goes to laundry every day); <b>radiator removed from Cultivation</b> (only the greenhouses & mother bays have one).                           |

### CHICKEN FARM — NEW MODULE 🐔

Everything you asked for is built & live — and the whole screen has an **AFR / ENG toggle** (top-right), defaulting to Afrikaans.

|        |                                                                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ✓ Done | <b>5 hokke, telling wysigbaar.</b> Coop 1: 2000 · Coop 2: 4200 · Coop 3: 2000 · Coop 4: 2300 · Coop 5: 10500 — change any count anytime (a reason is asked & logged). |
| ✓ Done | <b>Mortaliteit per hok</b> — daily deaths and a running total per coop.                                                                                               |
| ✓ Done | <b>Temperatuur per hok.</b>                                                                                                                                           |
| ✓ Done | <b>Vang (catch).</b> Date · chickens per crate · crates loaded → it works out the <b>total chickens for that day</b> for you.                                         |
| ✓ Done | <b>Slagpale (abattoir).</b> Date · crates on scale · chickens per crate · <b>total weight (kg)</b> · and <b>sign off</b> .                                            |
| ✓ Done | <b>Nuwe kuikens in.</b> Record each new chick intake (date · coop · count).                                                                                           |

✓ Done

**Live count per hok.** Each coop shows **birds left = placed – all deaths you've logged** (from the day the chicks came in) — e.g. Coop 1: 2,000 placed – 69 dead = **1,931 left**. Every mortality you enter, on any date, now subtracts.

✓ Done

**Crates tab (photo evidence).** Per-crate count + photo on loading, with manager verify / flag — kept as its own tab alongside Catch & Slagpale.

## ONE CHANGE ON YOUR SIDE

**The grow calendar / schedule** is now built & edited by the **Head of Cultivation (Lou)** only — you can still see it, the edit controls sit with Lou. One owner for the cycle plan.

**Everything else is unchanged — full add / edit / delete:** clone-room oversight · daily checks · mortality · BayGrid · deviations routed to you · tasks · cleaning · environment logs · Chickens · Facility 360.
