DECLARATION

This declaration ensures that the requirements of Section 22C and 22D and Regulation 23 and 24 of the Act, as the case may be, have been followed and that the information provided in the application is current and correct at the time it was signed by ILCO Farming. ILCO Farming herewith confirms that the cultivation operations and good manufacturing practices comply with the current acceptable quality principles as determined by SAHPRA and the National Department of Health (NDoH).

The licence number **0000000043MC - V2**

The physical address of our cultivation and processing facilities is at Hardus Farm, Viljoenskroon, Free State.

The Greenhouses function on a GACP basis in conjunction with ancillary support areas. The facility is designed to support post-harvesting activities in a GMP environment, compliant with all SAHPRA guidelines related to medicinal cannabis processing and is equipped to handle the full germination-to-finished-product process.

ILCO Farming management and all employees are aware of the importance of a compliant Quality Management System (QMS) in the continued success of the organisation, therefore, construction of the facility has been done to comply with all GACP guidelines related to medicinal cannabis cultivation and GMP guidelines for the processing and packing of dried Medicinal Cannabis Flower.

The facility has been designed to engage in the following activities:

- Germination, sexing and cloning
- Vegetation,
- Flowering,
- Harvesting,
- Drying,
- Hand Trimming,
- Bulk Packaging.

C.1.2. Pharmaceutical manufacturing or wholesaling activities as licensed or approved by the Competent Authorities.

ILCO Farming currently holds a medicinal cannabis cultivation and manufacturing licence, number: 0000000043MC - V2.

C.1.3. Any other manufacturing or wholesaling activities carried out on the site

No other manufacturing activities are performed on this site.

	Implementation Date:	01-09-2025
	Effective date:	01-09-2025
	Review date:	01-09-2026

The 8700m² facility was built in 2022 by a professional construction company with knowledge of GACP and GMP requirements. The site is enclosed by security barriers consisting of an electrified security fence with a security check point for personnel and vehicle entry/exit.

The facility is designed to cultivate and process 3 tons of GMP compliant medicinal cannabis annually, as dried flower.

The cultivation segment of the facility consists of 3 greenhouses (Mother room 304m², Vegetation room 304m² and Flowering room 1920m²) interconnected with a common passage between the three units, facilitating the operation of each greenhouse independently and ensuring the safe movement of flower into and out of the headhouse.

The office, boardroom, and archive areas are situated prior to entry into the processing facility.

The (8700m² Headhouse) can be divided into two separate areas, a GACP (Cultivation) and GMP (Processing) section. Movement of harvested flower from the cultivation area into the processing area is facilitated through an access-controlled airlock.

Entry into the cultivation and processing areas is governed by access control through a security check point. From this security checkpoint, either the GACP area or the GMP area can be accessed individually.

The GACP and GMP cultivation and processing areas each have their own entry points and gowning areas. Each of these areas have individual goods receiving and storage areas. Ablution and canteen facilities are provided separate to the cultivation and processing areas.

A covered pathway was built to cover all activities in cultivation such as moving plants from clone room to Veg room, harvesting to wet material receiving, veg room to flower room.

C.1.6.2. Size of site, types of building and their ages

The GACP cultivation area is accessible through the GACP changing rooms, providing access to the following individual operational rooms:

ROOM	AREA (m²)	AGE
Clone Room	60.30 m ²	3 Months
Veg Tunnel	304 m ²	3 Years
Flower Greenhouse	1920 m ²	2 Years
Mother room	60.30 m ²	3 Months

- Ensure compliance of the Change Control Procedures.
- Ensure compliance of the Quality Event Procedure.
- Ensure implementation of all pest and rodent controls.
- Ensure induction and training of employees.
- Ensure proper storage and retrieval of documentation.
- Ensure that the sampling of raw material and packaging material is in line with company procedures
- Ensuring compliance with the requirements of the Department of Health, SAHPRA, GMP, GACP and GDP/GWP.
- Handling of regulatory inspections at the site.
- Handling product recalls and investigating operational deficiencies.
- Implementation and maintenance of Quality Management System.
- Investigate all deviations (including OOS, OOT and OOE).
- Liaise with overseas clients regarding regulatory updates.
- Monitoring day-to-day operations.
- Performing product quality reviews.
- Plan and do Internal Audits.
- Review all SOPs.
- Review and approval of master validation program, including equipment, processes, Technical, and analytical methodology
- Reviewing completed batch production and laboratory control records of critical process steps before release for distribution.
- Support all validation and qualification activities.
- Vendor Development and Approval.

The QC Department is responsible for:

- Carry out process controls, including in-process checks, inspections, and batch clearances.
- Development of new testing methods where applicable.
- Ensuring Liaising with the external laboratories for analytical and microbial testing.
- Ensuring the testing of materials and finished product as per the approved methods.
- Raising deviations when the test results are not within specification.
- Sampling as per defined protocols.
- Testing samples as per defined protocols.

The Responsible Pharmacist (RP) is responsible for:

- Approving all procedures impacting the quality of products.
- Approving all specifications and master production instructions.

The role of Senior Managers in ILCO Farming

Senior management personnel have been appointed to further employ key personnel, qualified in each position, and operating in the company's vertical infrastructure. Senior management will ensure that competent staff with appropriate qualifications and skills are appointed to their relevant positions. They will also be responsible for the competence of the staff members under their control and ensure that they are qualified for the necessary operating structures set out by the company. Elements of the System include: the AR, Facility Manager, Quality Assurance Manager and RP all are responsible for QA master documentation, Quality Manual, standard operating procedures, master documentation, daily QA tasks and registers. Furthermore, senior managers will create a strong quality culture in the Organisation to ensure all employees are aware of their responsibilities.

C.1.9.4. Describe the audit Programmes (Self inspection or audits by external organisations)

Self-inspection:

The RP or appointed person shall conduct Self-Inspection audits on the whole facility to ensure that correct policies and procedures are always adhered to. Completed audit checklists and reports shall be filed for reference and inspection by management. All findings shall be noted, and corrective action shall be initiated, with follow-up audits performed. On-going corrective actions shall be documented, and repeated negative observations may be handled in a disciplinary manner. Self-Inspection audits are to be performed annually at a minimum on the facility, by the RP according to the Self-Inspection Checklist. The RP may schedule inspections across the year, focusing on different areas each month. To do the self-inspection correctly, the following SOP will be applicable **SOP 7-QMS-027: Procedure for Self-inspection Audit**.

Audits by external organizations:

ILCO Farming remains inspection ready for external inspections from organisations such as SAHPRA, International customers or Health Authorities and compliance bodies such as ISO9001 by following their self-inspection program and adhering to all requirements of their QMS.

C.1.9.5. Process to review results to ensure quality, safety, and efficacy of the product.

ILCO Farming follow extremely strict critical processes with regards to their product, to ensure the safety, quality, and efficacy of the product. **SOP 3-CUL-1: Procedure for critical process controls is utilised to**

Document Number:	Effective Date	Page Number
SMF/ILCO/4.6	01 September 2025	Page 17 of 47

	Review date:	01-09-2026

starting materials will be assessed in accordance with GAP and it will be the duty of the AR to ensure that appropriate pharmaceutical/non-pharmaceutical products such as seeds, nutrients, grow media, containers and printed materials or labels are sourced from approved suppliers and distributed by approved entities.

ILCO Farming follows **SOP 7-QMS-011: Procedure for Vendor Approval**, to perform a due diligence and compliance check on each vendor, prior to entering into a service level agreement (SLA) or Third-party contract, with the Supplier. The Company shares their specifications for these critical starting materials and test the Supplier's product against these specifications to ensure compliance. Where a Supplier is assessed and approved, the Company follows **SOP 7-QMS-011: Procedure for Vendor Approval**, to enter into a contractual agreement to ensure consistent supply of approved starting materials.

ILCO Farming provides all the necessary information relating to the identity, quality and performance of their products as well as their breeding history. The seeds will be of the appropriate quality and be as free as possible from contamination and diseases to promote healthy plant growth. The organisation will refer to **SOP 3-CUL-004: Procedure for importing seeds or clones**

C.1.9.8. The release for sale procedure of finished products

Before a product is allowed to be released for sale, products produced are required to have representative samples taken from each batch in order to ensure that the quality control test results fairly represent the batch and that there is sufficient retention sample for future investigations when required. **SOP 5-PDT-003: Procedure for Sampling.**

All medicinal cannabis product batches are tested according to quality control specifications and tests to ensure the products meet their pre-determined specification and comply with standards set by SAHPRA and the requirements of the European Monograph for Cannabis Flowers. All product produced for sale follow the testing requirements of **SOP 5-PDT-010: Procedure for Testing Requirements**. The contract laboratories provide the COAs for review.

Products produced by ILCO Farming are comprehensively reviewed by the QAM prior to the RP granting approval for release to local or international licensed markets. Products produced by the facility are checked for compliance with the master documents, and the Quality Control specifications prior to

	Effective date:	01-09-2025
	Review date:	01-09-2026

Training on Elements of GMP and GWP pertinent to this site, is formalised in an annual refresher training session. The QAM may present this training or request the QA consultant to complete this training with all personnel.

C.2.3.3. Form of training

All our staff receive induction training in-house according to a schedule proposed by the QAM and training is documented as per the SOPs referred to above. Personnel are assessed by completing questionnaires for each SOP, which will be marked to ensure that adequate comprehension and knowledge has been fulfilled. All training documentation are filed and stored for the document retention period of 5 years. The AR may schedule external training where required, on the job training will be conducted when errors or issues are noted in daily operations.

C.2.3.4. Assessment of training

The department head marks the tests and a total of 80% must be achieved. Tests are assessed based on written procedures in the QMS.

C.2.3.5. Retraining needs identification

If an employee does not achieve 80% or more, retraining is scheduled. Written assessments are conducted periodically to gauge the effectiveness of training Programmes. Employees who do not meet the necessary requirements, undergo immediate training assistance.

C.2.3.6. Recordkeeping

Documents and records are stored in hard and soft copy formats. Hard copies are protected in Lever Arch files and stored in an access-controlled room. Soft copies are stored on a password-protected computer on a virtual server. Documents and records may be communicated to interested parties upon request with approval. These interested parties may include but are not limited to SAHPRA and DALRRD.

Our Organisation recognises that recorded information is a key resource to effective operation and accountability, providing valuable evidence of activities and transactions. Records are vital to our facility in its current and future operations, in meeting legislative requirements, for the purpose of accountability and for an awareness and understanding of its history and procedures. A good record keeping program is fundamental to our commitment to administrative transparency and accountability. The training records

Any employee resuming duty after an illness involving a contagious disease shall provide a medical clearance certificate specifying his/her ability to attend to their job as required. Employees report back to the AR and are monitored accordingly. If at any time the AR declares the employee incapable or unfit to carry out the necessary tasks as per their job description, the AR will extend the rest period or refer the employee to a general practitioner (GP) for additional monitoring.

C.2.4.6. Additional monitoring for personnel in Grade A-D areas

Employees working in clean areas (Grade A-D) are subjected to additional monitoring by a medical practitioner appointed by ILCO Farming . The employee will report to the AR to determine whether the employee is fit to commence with his daily tasks.

C.2.5. Personnel Hygiene Requirements Including Clothing

Personnel are trained in the use of the sanitation facilities as well as the PPE and gowning requirements prior to entering the cultivation area or the processing facility. The site design affords separate washing, changing and rest areas outside of the processing areas, this ensures that sanitary working environments are upheld as per the **SOP 4-FAC-006: Procedure for Personal Hygiene and PPE**.

C.2.5.1. Washing, changing and rest areas

ILCO Farming has implemented high hygiene standards into the site's health care program. Detailed hygiene programs are established and adapted specifically to the needs within the different procedures on site. Training sessions and written examinations emphasize hygiene, including instructions relating to health, hygiene practices, instructions to use hand-washing facilities and clothing of personnel. These practices are promoted by management and widely discussed during training sessions regarding Good Housekeeping **SOP 4-FAC-005: Procedure for Good Housekeeping** as well as personal hygiene and correct use of personal protective equipment **SOP 4-FAC-006: Procedure for Personal Hygiene and PPE**.

The site is designated to provide separate canteen, ablutions for males and females as well as PPE areas, prior to entering the processing facility or the cultivation area. Eating, drinking, chewing, and smoking, or the storage of food, drink, smoking materials, and personal medication is not permitted within manufacturing areas or in any other area where they might adversely influence product quality or product safety. Direct contact is avoided between the operators' hands and starting materials, intermediates, and

C.3.3. Brief Description of Ventilation systems

C.3.3.1. Filter design and efficiency

ILCO Farming will also utilize air conditioners to maintain the required temperature and relative humidity specifications in the processing facility.

Temperature Specification: 15-25°C

Relative Humidity Specification: Varies between 40-62% dependent on the requirements of the processing area.

Airconditioners are installed in the following areas; 2 in trimming room, 3 in drying room 1, 2 in drying room 2, 1 in weighing & packaging, 1 in bulk storage, 1 in final product store. Dehumidifiers are installed in the following areas; 2 in trimming room, 2 in drying room 2, 4 in drying room 1, 1 in weighing & packaging, 1 in bulk storage, 1 in final product store.

C.3.4. Handling of highly toxic, hazardous, and sensitising materials.

The facility is dedicated for the processing of scheduled medicinal cannabis material. A chemical storage room is available on-site with secure access and controlled inventory. ILCO Farming does not use any highly toxic chemicals and all hazardous materials are stored in a dedicated area with the relevant warning signs and MSDS sheets. Staff are trained on safe handling of such materials.

Ethanol is stored in the chemical store on a dedicated shelf with a fire-extinguisher located near the area.

C.3.5. Water systems and sanitation

ILCO Farming utilizes borehole drinking water. Water testing results according to (SANS) 241:2015 are recorded every 6 months.

Document Number:	Effective Date	Page Number

C.3.5.6 Specification Reference for water

Ph. Eur for water; Purified water in bulk (01/2009:0008)

- a) Chemical: TOC N.M.T 0.5mg / Litre
Nitrates N.M.T 0.2 ppm
Aluminium N.M.T 10 ppb
Heavy Metals N.M.T 0.1ppm
- b) Conductivity: 4.3 uS-cm -1 @20 °C
- c) Microbiological: TVAC NMT 100 CFU / ml

The system is serviced by the contract service provider as per their SOP on a yearly basis and is back-washed by the cultivation manager once a month. Water is sampled from the tank directly after the RO unit and sent to a contract laboratory for testing. Water is sent for testing every 6 months.

C.3.6. Maintenance

C.3.6.1. The planned preventative maintenance programme

The site will maintain planned preventative maintenance programs to be in place for the following:

- Air-conditioning units
- Fire alarms/ fire extinguishers
- Alarm system for power failures
- Emergency generator
- Computer software/ hardware
- Temperature and Humidity probes
- Pest control equipment – bait boxes/insecticides
- Dehumidifiers
- Weighing Scales

Contractors are be appointed to perform the maintenance of each of the above equipment according to the scheduled preventative maintenance program per annum. Each Service Level Agreement (SLA) with each contractor provides details on the frequency of the maintenance as well as the processes that they are responsible for.

	Review date:	01-09-2026

Maintenance Manager to assess and schedule the activity. The AR will assess the scale of the maintenance with respect to any additional validation or calibration activities that may be required.

C.3.9. Qualification, Validation and Calibration

A Validation Protocol has been compiled to generate evidence relating to a facility, process, item of equipment or product. The Validation Protocol lists details of the tests to be carried out, the frequency of testing and the acceptance criteria; The type of Validation is stated – prospective, concurrent, retrospective. Installation Qualification, Operational Qualification and Performance Qualification are included where relevant. The Validation Protocol clearly describes the procedure to be followed for performing validation studies and the Validation Report records the results obtained from these studies.

The following is implemented and followed **SOP 7-QMS-009: Procedure for the Qualification and Validation Process.**

C.3.10. Sanitation

Management is ultimately responsible to ensure that Good Housekeeping is abided by. Good Housekeeping forms an important part of the working procedures and this decision shall be conveyed to all employees. The following shall be adhered to: - all areas shall be kept clean; doors shall be closed on vacating the premises. Walls shall be cleaned, and surfaces kept free of unnecessary items. No foodstuffs shall be allowed in the Facility, only in the designated eating areas for this purpose. The staff are trained on the following to uphold clean, acceptable standards **SOP 4-FAC-005: Procedure for Good Housekeeping.**

Cleaning detergents selected by ILCO Farming will be included in this SOP. Critical surface areas are sanitized with 70% IPA.

and finished products are prepared by the QC department, checked by the QA manager, and finally, authorized by the RP and AR. Production process documentation starts with raw material and ends with the finished product. All information is recorded in the Manufacturing Batch Record (MBR) document.

At a minimum, the MBR contains:

- | | |
|--|--|
| <ol style="list-style-type: none"> 1. Material Requisition <ol style="list-style-type: none"> a. Raw material b. Packaging c. Weight 2. Processing MBR <ol style="list-style-type: none"> a. Bulk production order b. Processing procedure c. Processing instruction 3. Packaging MBR <ol style="list-style-type: none"> a. Packaging material b. Packaging material order c. Packaging procedure d. Packaging instruction | <ol style="list-style-type: none"> 4. Packaging Material Reconciliation. 5. Finished Product Reconciliation. 6. Data yielded on production process implementation, such as processing data, inspection data, the inspection process, and environment conditions (including room temperature, relative humidity and air control), are recorded in the MBR. |
|--|--|

The following documents are utilized by the facility and are updated and maintained on site: Safety Data Sheets, Standard Operating Procedures, Data Sheets/Manuals, Training Materials, Production Logs, and Financial Logs.

C.4.2. Other documentation related to product quality

All Quality Control Procedures, Quality Assurance and Good Document Practice standards are managed by ILCO Farming ' Quality Management System that includes but is not limited to:

- Product quality documentation
- Specifications for disposables of cleaning materials
- Standard Operating Procedures
- Equipment specifications
- Quality Control procedures
- Training procedures
- Computer program specifications
- Documentation control of process deviations
- Calibration and test documents
- Validation documents

Temperature, Ventilation, and Drying time. Continuous QC testing has been implemented which will allow for the monitoring of the standardization and conformance to GSP and GMP standards.

Packaging

Product moved from the drying room to the pre-processing (Bulk Storage) room will be packaged and placed into tote bins to await COA and further processing. Once the COA has been received and the batch has been deemed conforming, trimming and sorting may take place. Once trimmed and sorted, the batch will be placed into Terploc bags to cure for a minimum of 2 weeks, before being placed into final packaging. Continuous in-process quality control measures will be implemented to eliminate substandard materials, contaminants, and foreign matter during the packing stage. The packing bags are labelled to identify the production batch. The packing labels include the product name, batch number and weight. All additional information about the production and quality parameters of the medicinal cannabis are recorded in a separate certificate by batch number. Records are kept of the batch packaging and will be linked to the certificates.

Storage

When storage takes place between packaging and pre-processing, storage procedures have been developed and implemented. The entire processing site is temperature-controlled, and the product is stored in a dry room at a controlled temperature. These products are stored off the ground on pallets or shelves. ILCO Farming cultivates under standardized conditions so that the content of the constituents is constant, and the protocols of the operations undertaken during cultivation are kept available. To standardize the product the following is controlled during cultivation: Cultivar of the cannabis plant, Cultivation substrate, Day length, Light intensity, Color temperature of the lighting, Atmospheric humidity, Temperature, Ventilation, Plant age, and Time of day of harvesting.

C.5.2. Handling of materials and products

All starting materials and packaging materials including bulk products are received immediately into quarantine status as per **SOP 6-PDT-001: Procedure for Supplier qualification and Goods Receiving ; SOP 5-PDT-001: Procedure for Goods in Quarantine**. The quality department assesses all materials for compliance to their specifications before releasing them for use. Products received such as packaging material and equipment is received according to the SOP on the receiving of goods. Once received it is moved into the quarantine area where it is checked. Once all checks have been performed according to the SOP, products/equipment are taken to the correct area in the facility. In the event that seeds will be

authorises the movement of approved batches to the secure finished product storage area upon receipt of a valid COA.

The following **SOP 5-PDT-002: Procedure for Goods in Quarantine**. Once the COA has been received back and has been tested according to quality control specifications to ensure the products meet their pre-determined specification and comply with standards set by SAHPRA and the EU Monograph for Cannabis Flowers, based on the Medicines and Related Substances Act, Act 101 of 1965.

According to **SOP 5-PDT-010: Procedure for Testing Requirements**, the product is then moved from Secondary Quarantine into the Finished Product Store to await a purchase order and delivery instructions. Products produced by the facility are checked for compliance with the master documents, and the Quality Control specifications prior to approval for final release for sale, using guidance from **SOP 5-PDT-011: Procedure for Finished Product Release**.

C.5.2.4. The role of the Authorized Representative

To oversee and manage all related QA standards and Good Practice. This includes but is not limited to the following:

- Standard Operating Procedures
- Process Operating Instructions
- Good Housekeeping Practices
- Staff Training and Development
- Facility and Product Handling
- Legal Matters Compliance
- Good Agricultural Practices
- Good Storage Practices
- CAPA; Preventative Maintenance
- Complaints,
- Recalls,
- Deviations
- Returned or rejected goods.
- Direct liaison with SAHPRA
- Self-Inspection

Supplier Area. If damage has occurred during delivery, ILCO Farming will notify the supplier within 24 hours of the delivery and request upliftment from the supplier.

When stock damages occur in the facility, they must be reported to the AR who will decide whether the damage can be rectified, or stock is to be labelled with a Reject sticker and placed in the Rejected Goods for Destruction area. Damaged and rejected goods must be stored in such a way that they do not cause potentially harmful effects or contamination. The company will maintain detailed records of non-conforming products, along with records of all subsequent corrective actions taken. If the product must be destroyed, the process is recorded, and the records are maintained for a period of five (5) years.

C.5.5. Brief Description of the General Policy for Process Validation

New equipment and processes —: Prospective Qualification & Validation will be initiated.
Existing equipment —: Concurrent Qualification & Validation will be performed.

Protocols will be compiled as per **SOP 7-QMS-009: Procedure for the Qualification and Validation Protocols, processes and Reports**. Each Protocol will be approved by the QA and AR, prior to implementation. Each completed Qualification & Validation report will be reviewed by the QA and the AR and approved prior to the equipment or process being considered approved. The validation protocol shall exist giving documentary evidence relating to the facility, process, item of equipment or product. The VP will list details of the tests to be carried out, the frequency of testing and the acceptance criteria; the type of validation is stated – prospective, concurrent, retrospective; installation qualification, operational qualification, and performance qualification will be included where relevant; The VP shall clearly describe the procedure to be followed for performing validation studies as well as record the results obtained from these studies. A validation report will be compiled, reviewed, and approved by QA and AR.

Prospective Validation

Prospective validation is conducted during the implementation phase on the first of three full-scale batches of product, where the validation result must comply with all requirements and be satisfactory. The first three validated batches will then be used to compile the updated BMR and BPR.

Concurrent Validation

Concurrent validation is conducted annually after prospective validation has been completed. If the product has not been produced in one-year, concurrent validation will be completed over the next production cycle.

C.7.CONTRACT MANUFACTURE AND ANALYSIS

There are written contracts between ILCO Farming and the Contract Acceptor/s which clearly establishes the responsibilities and duties of the parties. The contract clearly states the way in which the RP will be releasing each batch of product for sale, exercising his/her responsibility.

Analysis is performed to assess the quality of medicinal cannabis plant material or finished products before they reach the intended market, according to the guidelines set out by SAHPRA as well as the Off taker.

C.7.1. Technical Contract details and GMP compliance

A technical agreement ensures compliance to the current good manufacturing practices, by defining a clear technical agreement as set out in **SOP 7-QMS-012: Procedure for supplier qualification, approval and agreements**. Both parties will have their responsibilities defined thus avoiding conflicts and have a clear understanding as well an escalation route. The contract giver will specify their requirements and specify the requirements to be performed by the contractor acceptor. The technical contract should have the following:

- Abbreviations
- Scope
- Responsibilities for contract giver and acceptor personnel
- Policy
- Procedure – including roles and responsibilities of contract giver and contract acceptor.
- Approval
- Revision history
- List of products.

attend to the complaint. All attempts will be made to obtain the actual item(s) with a problem or at minimum a photograph of the problem product.

C.8.2.2. Product recalls

ILCO Farming shall provide full co-operation in the event of a medicinal cannabis product recall initiated when required. The recall procedure shall be performed in accordance with SAHPRA guidelines for the recall of a medicinal cannabis product according to **SOP 7-QMS-024: Procedure for Product Recall**, to ensure that any defective product originating from the facility is recalled and put through the recall process in a controlled manner, according to the SAHPRA requirements included in the SAHPRA Guideline for Recall/Withdrawal of Medicines (5.07).

The RP shall provide full co-operation in the event of a cannabis product recall required for medicines to be removed from the customer's market due to reasons relating to their safety, quality, or efficiency. The final decision on a recall shall be taken by the RP, in conjunction with the customer and the rules governing Health Authority recalls/withdraws in the customer's country.

C.9. SELF INSPECTION

C.9.1. The self-inspection system

The site follows **SOP 7-QMS-027: Procedure for self-inspection audit**.

The checklist in the SOP attachment is issued to the site personnel to complete. Deficiencies observed are recorded and the site proposes corrective actions to remedy these, and specify a timeline for completion of these remedies. A follow-up self-inspection is then performed in order to determine the effective implementation of the corrective actions proposed and to determine if the site is compliant in all areas included in this self-inspection checklist.

ILCO Farming follows the guidelines for GMP and GSP when performing a self-inspection as well as internal SOP for self-inspection. Key aspects of GMP and GSP are inspected and tested. Self-inspection is performed annually or as needed. All self-inspections performed are documented and followed-up. Corrective actions are initiated, and time-limits are set for completion of corrective actions. Retraining of personnel is appropriate where and when a self-inspection uncovers the need for this.
