

Scope — Loraine's cultivation requirements

Sourced from 17 photographs of the live paper forms, 3 pages of her hand-drawn system layout, and the overdue-task screenshot. Three workstreams. Estimates are working days for one developer.

Her core ask: "Jy moet op elke kamer kan click en dan is al sy papierwerk in sy eie vertrek, en alles is gelink aanmekaar van cloning af tot dispatch. Elke ding moet die batch nr by kry — van clone, tot in processing, tot die dag wat hy by die hek uit gaan."

1 · KILL THE TASK FLOOD — "ONS GAAN FOREVER CLICK"

Her screenshot shows a wall of overdue **Temp & Humidity** tasks — **one per tray, per day** (SL-M3-1-T7, SL-M4-1-T9, SL-M14-1-T21, CT-2026-001 ...), all routed to the Nursery Manager. One reading covers the **room**, not each tray. This is the same class of defect as the cuttings-noise fix, on the T&H side.

#	REQUIREMENT	EST.
1.1	Stop generating a Temp & Humidity task per tray ; collapse to one per room, per reading slot .	0.5 d
1.2	Clear the existing overdue backlog (bulk resolve, audited).	0.25 d
1.3	Remove the standalone "Checklist" nav item — superseded by the per-room checklists in §3.	0.25 d

Recommend doing this first. It is the cheapest item on the list and the one she is actively drowning in. ~1 day for immediate, visible relief.

2 · INVENTORY MODULE — REPLACE THE PAPER

She photographed the entire paper set. It reduces to **three form shapes** (more products still coming — "ek sal fotos van als neem").

#	REQUIREMENT	EST.
2.1	Per-product inventory log — Date · Product In · Stock In · Stock Out · Balance · Name · Sign · Comment. 11 products so far: Biodyne · Spliff · Pyrol · Diatomaceous Earth · Bittermag · Agrisil · Rooting Gel · Vectobac (Bacillus) · Cerasulfur · Neudosan · Hypochlorous Acid (HOCL).	2 d
2.2	Category stock sheets — Substrate (in KG) · Consumables (blades, scrogg net, baling twine) · Hygiene (sanitiser, hand soap, hair nets, beard covers, sleeve covers, gloves).	1.5 d
2.3	Chemical Product Register — Date · Time · Chemical · Batch Number · Expiry Date · Checked By · Remarks.	1 d
2.4	Balance auto-calculates (the single biggest source of paper error) + low-stock and expiry alerts .	1 d
2.5	Stock-out auto-deducts when a chemical is applied in the Activity Log — we already capture equipment # and dose there, so this closes the loop. (<i>Needs sign-off — see decisions.</i>)	1 d
2.6	Name / Sign become the logged-in user + audit trail (no wet signature needed).	0.5 d

Self-contained and high value — it disturbs nothing else in the system, and it kills a whole drawer of paper. Also a compliance win: a chemical batch + expiry tied to the plants it touched is exactly what an inspector asks for.

3 · ROOM-CENTRIC RESTRUCTURE — THE BATCH-NUMBER GOLDEN THREAD

Today the app is organised by **function** (Activity Log, Env Log, Cleaning, Tasks). She wants it organised by **room**, with each room holding its own paperwork, and every record stamped with the batch number.

#	REQUIREMENT	EST.
3.1	Room model + navigation. Cultivation: GH1 (Bays 1–3 → rows), GH2 (2 bays), Motherbay 1, Motherbay 2, Cloning. Processing: wet-material receiving · dry room 1 · dry room 2 · trimming · weighing & packaging · wash bay · chemical storage · receiving · bulk storage · final storage · storage room · sample room · rejected goods · dispatch · 2 hallways.	3 d
3.2	Each room carries its own logs — Temp & Humidity · Activity · Scouting · Daily checklist · Cleaning (daily/weekly/after-batch) · Culling · Mortality · Defoliation.	3 d
3.3	Re-parent existing data to rooms (activity, env, cleaning, mortality already exist — this is re-parenting, not rebuilding).	2 d

#	REQUIREMENT	EST.
3.4	New logs: Scouting, Defoliation (batch #, strain, weight), Culling by batch. (<i>Fields not in her photos — needs her input.</i>)	2 d
3.5	Batch # golden thread — every record in every room stamps the batch; one continuous chain clone → veg → flower → harvest → processing → dispatch, viewable end-to-end.	3 d
3.6	Per row: Batch # and amount harvested per row .	1 d

This is the real prize. The batch-number thread *is* seed-to-sale traceability — it is precisely the chain a SAHPRA inspector follows. Most of the underlying data already exists, so this is largely re-parenting and re-navigating what we have, plus a few new logs. **Build the room shell + two rooms first, prove it with her, then roll the rest.** Do not big-bang it.

Total estimate

~24 working days · 1 d + 7 d + 14 d + contingency

RECOMMENDED PHASING

PHASE 1 · ~1 DAY

Kill the task flood. Immediate relief, no risk.

PHASE 2 · ~7 DAYS

Inventory module. Self-contained, replaces the paper drawer.

PHASE 3 · ~14 DAYS

Room restructure, incremental — 2 rooms, prove, then roll.

DECISIONS NEEDED BEFORE WE BUILD

- A** Should a chemical application in the Activity Log **auto-deduct** stock? (**We recommend yes**) — it is the whole point of digitising it.
- B** **Scouting** and **Defoliation** logs — what fields? They are new; not in her photos.
- C** Room restructure — replace the navigation outright, or run it alongside and migrate? (**We recommend alongside**).
- D** Full product list for the inventory module — she has more photos coming.

Parked (not actioned): Loraine also asked to remove Edgar from the system and appoint Gertrude on mothers & clones. **Flo's instruction: leave Edgar.** No access revoked, no PIN rotated, nothing provisioned. Recorded so the request is not lost — will not be acted on without instruction.
