BY ILCO FARMING · TNT-ZA

THE OPERATIONS DRIVER

Every role, run by an AI co-pilot.

A shift from a system that **stores data** to one that **drives the work**. Each role gets an AI co-pilot grounded in its **SOPs and KPIs** that says **what to do now**, raises the **ticket** the moment something slips, and **allocates the day's work** — across the farm and every network pharmacy.

MOST OF THE ENGINE IS ALREADY BUILT

Per-role AI Q&A 15+ roles

KPI engine targets + live

Smart tickets auto-route + escalate

SOP → training + tasks

World model + risk

Event bus

The Driver connects them into a loop. It is thin glue + one rules engine — not a rebuild.

HOW IT DRIVES — THE LOOP

SENSE

Events + a scheduled tick keep state & KPIs live.

NEW · SMALL

EVALUATE

One rules engine spots KPI breaches, anomalies, overdue SOPs.

NEW · CORE

ACT

Auto-creates tickets / CAPA / tasks & allocates — reusing what exists.

REUSE

SURFACE

Each role's co-pilot opens with their live "what to do now" queue.

EXTEND CHAT

WHAT A ROLE SEES

The co-pilot doesn't wait to be asked. It opens with **"Here's your shift"** — today's SOP checklist, KPI status (green/amber), and the action queue. Ask it anything in your role's language; it answers from your SOPs & live state, and can **act** (close a ticket, complete a task, accept an allocation).

FM · Nursery Mgr · Nursery Staff · Cultivation Mgr/Head Grower · Processing · QA · RP

Driven, not passive:

- Clone rooting drops below 85% → ticket to the Nursery Manager.
- An SOP goes overdue → training + task auto-raised.
- Weight variance fires → QA + FM alerted, batch flagged.
- The day's SOP workload → auto-allocated across the shift.

HOW WE ROLL IT OUT

1

Close the loop — events + tick + the rules engine produce a read-only "what to do now" feed.

START

HERE prove the brain before it acts.

- 2 Wire it to **act** — drivers become tickets & tasks, auto-routed.
- 3 Per-role **Action Queue + co-pilot** — SOPs & KPIs injected, with memory.
- 4 **Auto-allocation** — fill the shift from the day's SOP workload.
- 5 **Executable chat** — the co-pilot runs actions, with audit.

Wire the heartbeat into a rules engine that reads the KPIs, anomalies and SOPs you already compute, turns breaches into the tickets you already auto-route, and hands every role a live "what to do now" — inside the assistant you already have.
