

Proving the seed-to-sale pipeline to SAHPRA & SAPC

Goal: demonstrate one cannabis batch flowing **cultivation** → **processing** → **lab/COA** → **dispatch** → **pharmacy** → **Section-21 dispense**, fully traced and audit-clean, to the medicines regulator (SAHPRA) and the pharmacy council (SAPC). Live demo + compliance document pack + on-site walk-through.

● **The one thing that must happen first — a proof run.** The system has the full capability, but the live DB has **0 batches** and **0 COAs** — the pipeline has never been run end-to-end with real data. You cannot "prove" a pipeline that has no finished, tested, dispensed batch to show. **Week 1 is dedicated to walking one real (pilot) batch the whole way** so there is an actual COA and an actual Section-21 dispense on screen.

WHO GOVERNS WHAT — REGULATOR MAP (CONFIRM WITH YOUR MEDICINES-LAW + PHARMACY SPECIALIST)

BODY	GOVERNS	WHAT THEY'LL WANT TO SEE
SAHPRA (health-products / medicines regulator)	Cultivation → manufacture → product quality (the farm + processing end). GMP. Section-22C(1)(b) licensing. Section-21 access authorisations.	Seed-to-sale traceability, GMP/QMS, batch records, COAs, deviations/CAPA, destruction (SAPS-witnessed), the Site Master File, tamper-evident records.
SAPC (SA Pharmacy Council)	The pharmacy + the pharmacist — premises, dispensing, dispensing records, scheduling control (the retail/dispense end).	Pharmacist oversight of dispensing, Section-21 patient/script controls, dispensing audit trail, stock control, who-dispensed-what records.
(context) HPCSA + Section 21	HPCSA registers the prescriber ; Section 21 (Medicines Act) is the patient-access mechanism that joins farm product to a specific patient.	The prescriber → Section-21 authorisation → dispense chain is what links the two regulators' domains.

Do not assert regulatory specifics without sign-off. The mapping above is orientation only. Exact licence conditions, what each body formally requires at a demonstration, and any scheduling/Section-21 wording must be confirmed by a medicines-law + pharmacy specialist before anything is put in front of a regulator. (Note: "Section 22A" is not a licence.)

THE PIPELINE → WHAT'S LIVE VS THE GAP

#	PIPELINE STAGE	SYSTEM CAPABILITY	REGULATOR	STATE
1	Cultivation (mother → clone → veg → flower)	BayGrid seed-to-sale, mothers/clones, activity/env/IPM logs	SAHPRA	LIVE
2	Harvest → processing (dry/trim/pack)	Harvest capture, container + weight tracking, variance alerts	SAHPRA	LIVE
3	Batch creation	Batch model (B-YYYY-NNN), genealogy to mother	SAHPRA	0 batches — run it
4	Lab test → COA	LabResult + COA (PDF + QR), lab-gated dispatch	SAHPRA	0 COAs — run it
5	Dispatch → transport	Transport manifest, lab-gated release	SAHPRA	LIVE (unused)
6	Pharmacy receipt → stock	Origin POS branch stock (receive/adjust), owner/pharmacist roles	SAPC	LIVE
7	Section-21 dispense to patient	Section-21 order gate, patient/doctor/pharmacist vetting queue	SAPC + SAHPRA	LIVE (verify flow)
—	Spanning all stages	Append-only SHA-256 hash-chained audit (4,466 rows) · 7-tier RBAC + role-gated regulated actions · QMS (218 deviations/CAPA) · SOP library · 22 compliance sources (EU-GMP/SAHPRA/SAPC/SA-Law)	Both	LIVE

THE THREE WAYS WE PRESENT IT

1 • Live system demo. Walk the pilot batch on the real system, screen-shared or on the POSBANK: BayGrid lineage → harvest → batch → lab → COA (open the PDF) → dispatch → pharmacy receipt → Section-21 dispense. Then show the **audit trail** reproducing that exact batch's history, and the RBAC (each role sees only its own actions).

2 • Compliance document pack. A branded PDF mapping every regulator concern → the live feature that satisfies it, with screenshots + the pilot batch's COA and audit extract as evidence. Two sections: SAHPRA (cultivation/GMP/quality) and SAPC (pharmacy/dispensing). *Regulatory copy specialist-reviewed before issue.*

3 • On-site walk-through. Regulators at the farm + shop; each physical step shown against the system in context — the mother bay ↔ BayGrid, the processing rooms ↔ container tracking, the pharmacy ↔ Section-21 dispense. (This is where Loraine's Phase-3 room-by-room view pays off — parked but relevant.)

THE ~2-WEEK PLAN

WEEK 1 — MAKE IT REAL

Run ONE pilot batch end-to-end → real COA + real Section-21 dispense. Verify each stage writes to the audit chain. Fill SOP gaps for the stages shown (only 3 SOPs live). Confirm the Section-21 dispense flow works front-to-back.

WEEK 2 — PACKAGE & REHEARSE

Build the demo script, the compliance doc pack (specialist-reviewed), and the on-site walk-through route. Dry-run the demo end-to-end. Pre-brief with the specialist. Lock the date.

GAPS & DECISIONS BEFORE WE PRESENT

- A Pilot batch source.** Which strain/mother do we run through as the proof batch? Is there physical stock far enough along to produce a genuine harvest→COA, or is this a documented dry-run?
- B Lab & COA.** A real COA needs a real lab result. Do we have a lab partner result to load, or do we demonstrate the COA mechanism with a clearly-marked sample?
- C Specialist sign-off.** Who is the medicines-law + pharmacy specialist that reviews all regulator-facing copy? Nothing goes to SAHPRA/SAPC without it.
- D GMP status.** The SAHPRA GMP application status feeds directly into the SAHPRA conversation — confirm current standing.
- E Pharmacy registration.** The SAPC side assumes a registered pharmacy + responsible pharmacist. Confirm the pharmacy's SAPC standing and who the dispensing pharmacist of record is.
