

The grow calendar is yours — and it now does the work for you

A few changes to make running the cultivation cycle faster and quieter.

The grow calendar is now Head-of-Cultivation only. You build and adjust it — the Cultivation Supervisor and other roles can view it but can't change it. One owner, no surprises.

1 ADJUST PHASE LENGTHS — EVERYTHING ELSE MOVES ITSELF

On the Grow Calendar, you can now **tune veg / flower days**. When you change a phase, the **whole calendar re-flows automatically** — every downstream phase, task and reminder shifts to match. You see a **live harvest-date preview** ("new harvest ≈ 12 Aug, 5 days earlier") before you confirm, and a reason is captured for the record.

2 SHIFT THE WHOLE CYCLE

If rooting is delayed or a heat event hits, **Reschedule cycle** shifts the start date and re-flows the entire plan in one action. (If harvest moves earlier, a change-control note is logged automatically — GMP stays clean.)

3 A MUCH QUIETER BOARD

- The **"Build grow calendar"** reminders no longer pile up — it's one at a time now (genesis had stacked up ~58; cleared to one).
- Each new clone tray creates **~5 tasks instead of ~25** — the daily clone-room temp/humidity is one tray task, not one per day.

4 HARVEST APPROVALS

Harvest requests are approved by **you and QA** — so the call stays with the people who own the crop and the quality.
