

PROCESSING

The Digital Processing Workflow

From harvest intake to dispatch — drying, trimming, curing, lab release.
Container-tracked, weight-verified, and signed off at every hand-over. The
paper mountain, automated.

FROM WET HARVEST TO RELEASED PRODUCT — ONE TRACKED CHAIN

HARVEST

DRY

TRIM

CURE

LAB / COA

RELEASE

THE CONTROL THAT RUNS THROUGH IT ALL — CONTAINER TRACKING

Weight at every zone

Every container (bin → rack → bag → jar) is weighed at each hand-over. **Variance beyond expected loss auto-alerts** all senior roles — diversion control.

Handover with sign-off

A different person per zone; each hand-over is signed and audit-logged. No gaps in the chain.

Batch-linked

Everything carries the batch # (B-2026-NNN) from cultivation → genealogy preserved to the gram.

Forms auto-fire

Cleaning, drying logs, weight verification — auto-scheduled to Processing for sign-off, no paper.

The shift for Processing: clipboards, weigh-and-write, re-key, file → **scan → weigh → sign. The chain builds itself.**

01

Intake & Drying

HARVEST RECEIVED · DRY ROOM

WHAT HAPPENS

Harvest intake

The harvest request from cultivation lands as a **batch**; wet weight captured into a container with a QR.

Dry-room conditions

Temp & humidity logged on schedule; the dry-room cleaning & sanitation form auto-appears daily.

Weight tracking

Container weighed in and out → drying loss recorded; abnormal loss auto-flags.

Container moves

Each move (zone → zone) is scanned + signed — the location is always known.

Paper: Drying log · Dry-room cleaning · Weight sheet → **auto tasks + container weigh-events**

02 Trim

TRIM ROOM · CREW + WEIGHTS

WHAT HAPPENS

Trim sessions

A session per batch; trimmers assigned, input/output weights captured → trim yield + waste recorded.

Grade split

Output split by grade (A / B / Pops / Trim) per container — the inventory grades roll up automatically.

Trim-room hygiene

Cleaning & sanitation form auto-appears daily for sign-off.

Reconciliation

Wet → dry → trimmed weights reconcile per batch; gaps flag for QA.

Paper: Trim sheet · Trimmer log · Cleaning → **digital trim session + auto cleaning task**

03

Cure → Lab / COA

CURING JARS · TESTING · RELEASE

WHAT HAPPENS

Curing

Cured in QR jars; container events track each open/weigh; conditions logged.

Lab testing

Lab results captured per batch (potency, micro, etc.); pass/fail recorded → **batch quarantined** until cleared.

COA issued

On pass, the **Certificate of Analysis** is issued with a QR — the release evidence.

QA sign-off

Responsible Pharmacist / QA signs the release; a compliance ticket blocks release without it.

Paper: Cure log · Lab submission · COA · Release form → **digital lab result + COA + gated QA sign-off**

QA Deviation/CAPA · Release

release gate enforced

04

Release & Dispatch

TRANSPORT MANIFEST · TO RETAIL / EXPORT

Released product

Only COA-cleared, QA-signed batches can dispatch — enforced, not optional.

Transport manifest

Manifest with batch #s, vehicle, transporter, route; expected vs actual transit auto-flags.

To Origin Retail / export

Batch release syncs to the POS / export pack; full genealogy travels with the product.

Destruction (if needed)

SAPS-witnessed destruction events captured with weight + officer + photo evidence.

THE RESULT — FOR PROCESSING

Bottom line for Jeanette: every clipboard becomes a **scan-weigh-sign** on a tablet. Weights reconcile, the chain of custody is unbroken, and the release pack is inspection-ready — the system does the admin, the crew does the work.
