ROLE ACTIVATION — REVIEW & GAP ANALYSIS

ROLES TO ACTIVATE · WEEK OF 9 JUNE 2026

To bring the farm and pharmacy roles live, each role needs three things working together: **(1)** the tools to do the job (close the functional gaps below), **(2) interactive training built into their own dashboard** — step-by-step on real screens, never a PDF manual, and **(3) a one-tap way to flag bugs & ideas** that flows straight to the owner's backlog. This review is grounded in the actual TnT-ZA code.

READINESS AT A GLANCE

How close each role is to operating end-to-end today.

ROLE	READINESS	BIGGEST BLOCKER
Facility Manager Renaë Purdon	 ~70%	No staff shift-allocation calendar; critical-variance alerts not wired
Cultivation Nursery Mgr · Nursery Staff · Cultivation Mgr / Head Grower	 ~60%	Daily-check backend returns empty; no photo capture on steps
Processing Processing Mgr · trimmers	 ~65%	No QA-decision endpoint; no packaging phase
QA / Compliance Keke (QA)	 ~40%	QA sign-off + GMP audit forms not backed; batch quarantine missing
Responsible Pharmacist Berne Swart · network RPs	 ~10%	Dashboard shell only — no Schedule-6 register, S21 intake or PIL

PER-ROLE GAPS TO ACTIVATE

Grounded in the codebase — what works, and the concrete blockers.

FACILITY MANAGER

PARTIAL · ~70%

Works: Facility 360, anomalies, QMS/SOPs, harvest approval, trim, dispatch, HR. Gaps:

- Staff **shift-allocation calendar** (assign people to zones by day) — not built
- Critical weight-variance → **email/SMS alert** to FM not wired
- Harvest-request approve endpoint to verify end-to-end
- Photo proof on harvest/trim handovers

CULTIVATION

PARTIAL · ~60%

Roles: Nursery Manager, Nursery Staff, Cultivation Manager / Head Grower. (*Head-of-Cultivation trains on **GroOS**, a separate app — not part of TnT-ZA training.*)

Works: plant register, phase changes, feeding, mortality, bay grid. Gaps:

- **Daily-check sheets** fall back to empty — backend not wired
- No **photo capture** on checks / scans / mortality / IPM (SOP needs it)
- IPM scouting + cleaning schedule are view-only
- No SOP-training prerequisite gate before plant operations

PROCESSING

PARTIAL · ~65%

Works: trim sessions + weights, containers, lab results, batches, dispatch. Gaps:

- No unified **QA-decision endpoint** (approve/reject/rework + audit)
- No explicit **packaging phase** / hand-off to QA
- Lab out-of-spec triage (retest / quarantine) form missing
- Trimmer→supervisor handover photo + sign-off missing

QA / COMPLIANCE

NEEDS WORK · ~40%

Works: anomaly resolution, SOP/deviation list, append-only audit log. Gaps:

- **QA sign-off decision endpoint** missing (the critical one)
- **GMP audit** form (findings → corrective actions) not backed
- Batch **quarantine / retest** state machine missing
- Deviation/CAPA closure + verification not capturable

RESPONSIBLE PHARMACIST

NOT READY · ~10%

Currently a dashboard shell with mock data. Gaps:

- **Schedule-6 digital register** (dispense event, witness, RP signature)
- **Section 21 prescription intake** + validation + dispensing authority
- **PIL generation** per product
- Cold-chain monitoring backend; RP signature endpoint + audit anchor

TWO MODULES EVERY ROLE GETS

The activation layer you asked for — the same for every dashboard.

1 · INTERACTIVE IN-DASHBOARD TRAINING

Training lives **inside each role's dashboard**, on the real screens — not a separate course or a PDF. A guided, step-by-step walkthrough of that role's actual daily workflow, that anyone can finish without help.

- › Role-aware: Nursery Staff are walked through plant register → daily check → phase change; an RP through prescription intake → dispense → sign-off.
- › Interactive coach marks / guided steps on the live UI, with "try it" checkpoints and progress tracking per person.
- › Tied to the competency record — completing the walkthrough logs training (links to the SOP-training gate).
- › Re-runnable any time from the dashboard ("Show me how").

2 · IN-DASHBOARD BUG & IDEA ASSISTANT → YOUR BACKLOG + KANBAN

Every role gets a small **AI assistant in their dashboard** to report a bug or suggest an enhancement in plain language. It captures context (role, page, what they were doing) and files it straight to a **working backlog** and a **draggable kanban board — for you**.

- › One tap from any screen: "Report a bug / suggest something" → the assistant asks 1–2 clarifying questions, auto-tags role + page + severity.
- › Flows to an owner-only board: **New** → **Triaged** → **In progress** → **Done**, drag-and-drop, filter by role / facility / type (bug vs enhancement).
- › Turns every person on the farm + every network pharmacy into a live feedback channel — you see exactly what's breaking and what they want, in one place.

The Three Critical Blockers

Fix these first — they unblock multiple roles.

- 1 · **Daily-check backend** — unblocks all of Cultivation's day-to-day. Wire the zone config + submission + audit trail.
- 2 · **QA-decision endpoint** — unblocks both Processing and QA/Compliance sign-off and batch release.
- 3 · **Section 21 dispensing workflow** — the Responsible Pharmacist can't operate without it (register + intake + signature).

Suggested Activation Order

#	ACTIVATE	WHY FIRST
1	Facility Manager	Highest readiness (~70%); add shift calendar + alerts → FM oversees everyone else's rollout
2	Cultivation	Fix daily-check backend + photo capture → the largest crew goes live
3	Processing + QA	Share the QA-decision endpoint; activate together
4	Responsible Pharmacist	Needs the most build (S21 register/intake/PIL); pair with Röscher onboarding
